Problem Analysis

Describe Problem			Identify Possible Causes			Evaluate Possible Causes		Evaluate Possible Causes				
State the problem (one object, one deviation)			Use knowledge and experience OR...			Test possible causes		Test possible causes				
What object (or group of objects) has the deviation?		What deviation does it have?	What pairs in the Problem Specification are surprising? What else could have caused this deviation?		Record possible causes ➡		For each IS/IS NOT pair, answer the following question: If (Possible Cause) is the cause of (Problem Statement), then how does it explain both the IS and IS NOT information?		For each IS/IS NOT pair, answer the following question: If (Possible Cause) is the cause of (Problem Statement), then how does it explain both the IS and IS NOT information?			
What do we see, hear, feel, taste, smell, or measure that tells us there is a deviation?		What data tells us it exists?	...Use distinctions and changes		Record possible causes ➡		If (Possible Cause) is the cause of (Problem Statement), then how does it explain both the IS and IS NOT information?		If (Possible Cause) is the cause of (Problem Statement), then how does it explain both the IS and IS NOT information?			
Specify the problem			Look for Distinctions What is different, odd, unusual, special, unique, or peculiar about each IS compared to its IS NOT? What else is different...? * New information * Based on facts * True only of the IS			Look for Changes What changed in, on, around, or about each distinction? When did the change occur? Record date and time What else has changed...? If no change, use NKC - No Known Change		(Y) YES, explains because... (N) NO, does not explain because... Record supporting data		(Y) YES, explains because... (A) Explains ONLY IF (assumption)... List all assumptions		
								<input type="checkbox"/> MPC		<input type="checkbox"/> MPC		
			Distinctions			Changes		Y, N, A		Y, N, A		
WHAT												
What object?												
What deviation?												
WHERE												
Where geographically?												
Where on the object?												
WHEN												
When first?												
When since?												
What pattern?												
When in the life cycle?												
EXTENT												
How many objects?												
What is the trend?												
What is the size?												
What is the trend?												
How many deviations?												
What is the trend?

		<i>What identical things need the same fix?</i> <i>What problems could this fix cause?</i>																				

1 Describe Problem

When to use Problem Analysis?	State the problem
<p>Do we have a deviation?</p> <p>Is cause unknown?</p> <p>Do we need to know cause to take effective action?</p> <p style="text-align: center;">Yes to all 3 = use Problem Analysis</p>	<p>What object (or group of objects) has the deviation?</p> <p>What deviation does it have?</p> <p>What do we see, hear, feel, taste, smell, or measure that tells us there is a deviation?</p> <p>What data tells us that a deviation exists?</p> <p>Write a short statement with one object and one deviation</p> <p>Be specific; separate if needed</p>
Specify the problem	
<p>Ask IS/IS NOT questions in four areas:</p> <p>WHAT - Identity</p> <p>WHERE - Location</p> <p>WHEN - Timing</p> <p>EXTENT - Size</p>	<p>For each IS, ask questions to find IS NOTs that are:</p> <ul style="list-style-type: none"> • similar to the IS • specific • closely related to the IS • factual <p>“...could be, but is not.”</p> <p>If you “need more data” (NMD), determine who will obtain it, how and by when</p>
Problem specification	
IS	IS NOT
Describe the problem in detail	Tighten the IS data. Help eliminate false possible causes
<p>WHAT</p> <ul style="list-style-type: none"> • What specific object(s) has the deviation? • What is the specific deviation? 	<ul style="list-style-type: none"> • What similar object(s) could have the deviation, but does not? • What other deviations could be observed, but are not?
<p>WHERE</p> <ul style="list-style-type: none"> • Where is the object when the deviation is observed (geographically)? • Where is the deviation on the object? 	<ul style="list-style-type: none"> • Where else could the object be when the deviation is observed, but is not? • Where else could the deviation be located on the object, but is not?
<p>WHEN</p> <ul style="list-style-type: none"> • When was the deviation observed first (in clock and calendar time)? • When since that time has the deviation been observed? What pattern? • When, in the object's history or life cycle, was the deviation observed first? 	<ul style="list-style-type: none"> • When else could the deviation have been observed first, but was not? • When since that time could the deviation have been observed, but was not? What could be the pattern? • When else, in the object's history or life cycle, could the deviation have been observed first, but was not?
<p>EXTENT</p> <ul style="list-style-type: none"> • How many objects have the deviation? • What is the trend in the number of objects with the deviation? 	<ul style="list-style-type: none"> • How many objects could, but do not? • What could be the trend, but is not?
<ul style="list-style-type: none"> • What is the size of a single deviation? • What is the trend in the size? 	<ul style="list-style-type: none"> • What could be the size, but is not? • What could be the trend, but is not?
<ul style="list-style-type: none"> • How many instances of the deviation are on each object? • What is the trend in the number of instances? 	<ul style="list-style-type: none"> • How many instances could be on each object, but are not? • What could be the trend in the number of instances, but is not?

2 Identify Possible Causes

Use knowledge and experience	OR	Use distinctions and changes
<p>Refer to the Problem Specification to generate possible causes</p> <p>What pairs in the Problem Specification are surprising?</p> <p>What causes do they suggest?</p> <p>What else could have caused this deviation?</p> <p>What would experts say?</p> <p>What was our initial hunch?</p> <p>Explain how the cause creates the deviation</p>	<div style="border-left: 1px dashed black; height: 100px; margin: 0 auto; width: 2px;"></div>	<p>Look for Distinctions</p> <p>What is different, odd, unusual, special, unique, or peculiar about each IS compared to its IS NOT?</p> <p>What else is different...?</p> <p>*Based on facts</p> <p>*New information about that IS/IS NOT pair</p> <p>*True only of the IS</p> <p>Look for Changes</p> <p>What changed in, on, around, or about each distinction?</p> <p>When did the change occur? Record date and time</p> <p>What else has changed...?</p> <p>How could this... Change Change plus distinction Change plus change Distinction ...cause this deviation?</p>
		<p>List without debate</p> <p>Explain how the cause creates the deviation</p>

3 Evaluate Possible Causes

Test possible causes
<p>If (Possible Cause) is the cause of (Problem Statement), then how does it explain both the IS and IS NOT information?</p> <p style="text-align: center;"> Record supporting data List all assumptions Eliminate any cause that fails Complete testing one possible cause at a time </p>

{

The answer will be:

YES, explains because..., or

NO, it does not explain because..., or

Yes, explains ONLY IF (assumption)...

Determine most probable cause

<p>Which of these causes makes the most sense?</p> <p>Most probable cause (MPC) has:</p> <p>Assumptions that make the most sense in this situation</p> <p>Most reasonable assumptions</p>	<p>Overall simplest assumptions</p> <p>Fewest assumptions</p>
---	---

4 Confirm True Cause

Verify assumptions, observe, experiment, or try a fix and monitor
<p>What can be done to verify any assumptions made?</p> <p>How can this cause be observed at work?</p> <p>How can we demonstrate the cause-and-effect relationship?</p> <p>When corrective action is taken, what results will indicate that we have identified the true cause?</p> <p>Use the safest, easiest, quickest, cheapest, surest way</p>
